TYPOGRAPHY

font-size

Utilities for controlling the font size of an element.

Class	Styles
text-xs	font-size: var(--text-xs); /* 0.75rem (12px) */ line-height: var(--text-xs--line-height); /* calc(1 ⁄
text-sm	font-size: var(--text-sm); /* 0.875rem (14px) */ line-height: var(--text-sm--line-height); /* calc(1.2
text-base	font-size: var(--text-base); /* 1rem (16px) */ line-height: var(--text-base--line-height); /* calc(1
text-lg	font-size: var(--text-lg); /* 1.125rem (18px) */ line-height: var(--text-lg--line-height); /* calc(1.7
text-xl	font-size: var(--text-xl); /* 1.25rem (20px) */ line-height: var(--text-xl--line-height); /* calc(1.7
text-2xl	font-size: var(--text-2xl); /* 1.5rem (24px) */ line-height: var(--text-2xl--line-height); /* calc(2
text-3xl	font-size: var(--text-3xl); /* 1.875rem (30px) */ line-height: var(--text-3xl--line-height); /* calc(2.
text-4xl	font-size: var(--text-4xl); /* 2.25rem (36px) */ line-height: var(--text-4xl--line-height); /* calc(2.
text-5xl	font-size: var(--text-5xl); /* 3rem (48px) */ line-height: var(--text-5xl--line-height); /* 1 */
text-6xl	font-size: var(--text-6xl); /* 3.75rem (60px) */ line-height: var(--text-6xl--line-height); /* 1 */

tailwindcss

text-9xl	font-size: var(--text-9xl); /* 8rem (128px) */ line-height: var(--text-9xl--line-height); /* 1 */
text-(length:<custom-property>)	font-size: var(<custom-property>);
text-[<value>]	font-size: <value>;

EXAMPLES

Basic example

Use utilities like `text-sm` and `text-lg` to set the font size of an element:

text-sm

The quick brown fox jumps over the lazy dog.

text-base

The quick brown fox jumps over the lazy dog.

text-lg

The quick brown fox jumps over the lazy dog.

text-xl

The quick brown fox jumps over the lazy dog.

text-2xl

The quick brown fox jumps over the lazy dog.

≈ tailwindcss

`<p class="text-2xl ...">The quick brown fox ...</p>`

Setting the line-height

Use utilities like `text-sm/6` and `text-lg/7` to set the font size and line-height of an element at the same time:

text-sm/6

So I started to walk into the water. I won't lie to you boys, I was terrified. But I pressed on, and as I made my way past the breakers a strange calm came over me. I don't know if it was divine intervention or the kinship of all living things but I tell you Jerry at that moment, I *was* a marine biologist.

text-sm/7

So I started to walk into the water. I won't lie to you boys, I was terrified. But I pressed on, and as I made my way past the breakers a strange calm came over me. I don't know if it was divine intervention or the kinship of all living things but I tell you Jerry at that moment, I *was* a marine biologist.

text-sm/8

So I started to walk into the water. I won't lie to you boys, I was terrified. But I pressed on, and as I made my way past the breakers a strange calm came over me. I don't know if it was divine intervention or the kinship of all living things but I tell you Jerry at that moment, I *was* a marine biologist.

```
<p class="text-sm/6 ...">So I started to walk into the water...</p>
<p class="text-sm/7 ...">So I started to walk into the water...</p>
<p class="text-sm/8 ...">So I started to walk into the water...</p>
```

tailwindcss

Typography > font-size

```
<p class="text-[14px] ...">
  Lorem ipsum dolor sit amet...
</p>
```

For CSS variables, you can also use the `text-(length:<custom-property>)` syntax:

```
<p class="text-(length:--my-text-size) ...">
  Lorem ipsum dolor sit amet...
</p>
```

This is just a shorthand for `text-[length:var(<custom-property>)]` that adds the `var()` function for you automatically.

Responsive design

Prefix a `font-size` utility with a breakpoint variant like `md:` to only apply the utility at medium screen sizes and above:

```
<p class="text-sm md:text-base ...">
  Lorem ipsum dolor sit amet...
</p>
```

Learn more about using variants in the **variants documentation**.

Customizing your theme

Use the `--text-*` theme variables to customize the font size utilities in your project:

tailwindcss

Now the `text-tiny` utility can be used in your markup:

```
<div class="text-tiny">
  <!-- ... -->
</div>
```

You can also provide default `line-height`, `letter-spacing`, and `font-weight` values for a font size:

```
@theme {
  --text-tiny: 0.625rem;
  --text-tiny--line-height: 1.5rem;
  --text-tiny--letter-spacing: 0.125rem;
  --text-tiny--font-weight: 500;
}
```

Learn more about customizing your theme in the **theme documentation**.
